Seat Performance in Rear Impacts

Currently assessed through...

- Low-speed tests
 - IIHS (IIWPG pulse): 16 km/h, 10g
 - EuroNCAP: 16 km/h, 5 g; 16 km/h, 10 g; 24 km/h, 7.5 g
- Geometric assessment
- Quasistatic tests (e.g., FMVSS 207 seatback pull tests)

Question

- How do these assessments relate to seat performance in higher speed rear impact?
 - FMVSS 301R fuel system integrity tests (e.g., 36.5 km/h, 15 g; Edwards et al. 2019)

Parametric Rear Impact Seat Modeling

Goal: Use a parametrically modifiable seat model to study...

- The influence of various seat design characteristics (geometry stiffness) on rear impact response
- The relationship between quasistatic and dynamic assessment, and low-speed vs. high-speed response

Parametric Model

Occupant (BioRID, THOR-50M,
GHBMC-50M)
Static vs. Dynamic Assessment

	Crash	IIWPG	FMVSS301R
Occupants			
BioRID		X	
THOR-50M			X
GHBMC-50M		X	X

Parametric Modeling

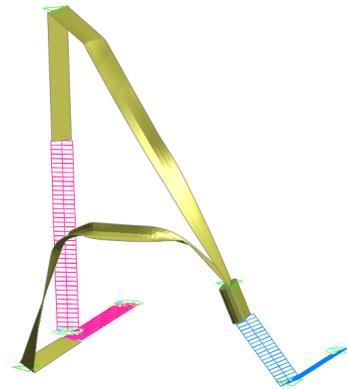

Goal: Use a parametrically modifiable seat model to study...

- The influence of **various seat design characteristics** (geometry stiffness) on rear impact response
- The relationship between quasistatic and dynamic assessment, and low-speed vs. high-speed response

Parameters/Variables

Belt (Pretensioner)

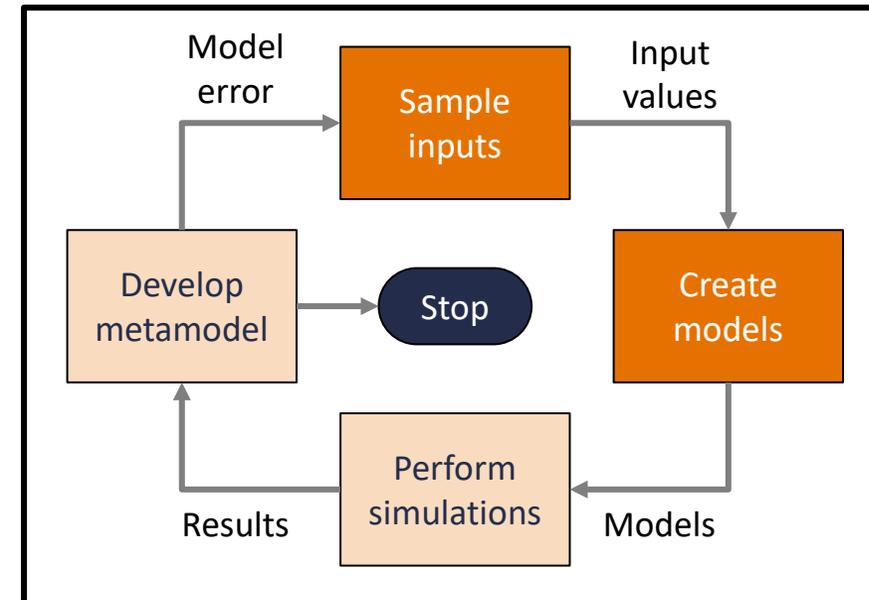

Occupant and Crash Pulse

Crash Occupants	IIWPG	FMVSS301R
	BioRID	X
THOR-50M	X	X
GHBM-50M	X	X

Simulation Automation Summary

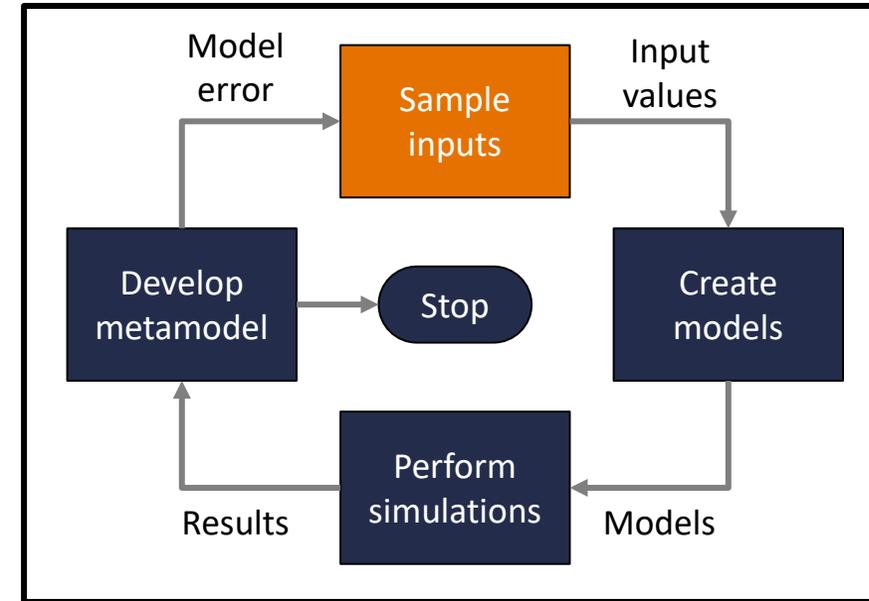

Fully Automated Workflow with THOR-50M, GHBMC-50M, BioRID

- **200 sampled seat designs** morphed from OpenVT seat, based on Principal Component Analysis of scanned seats in the fleet

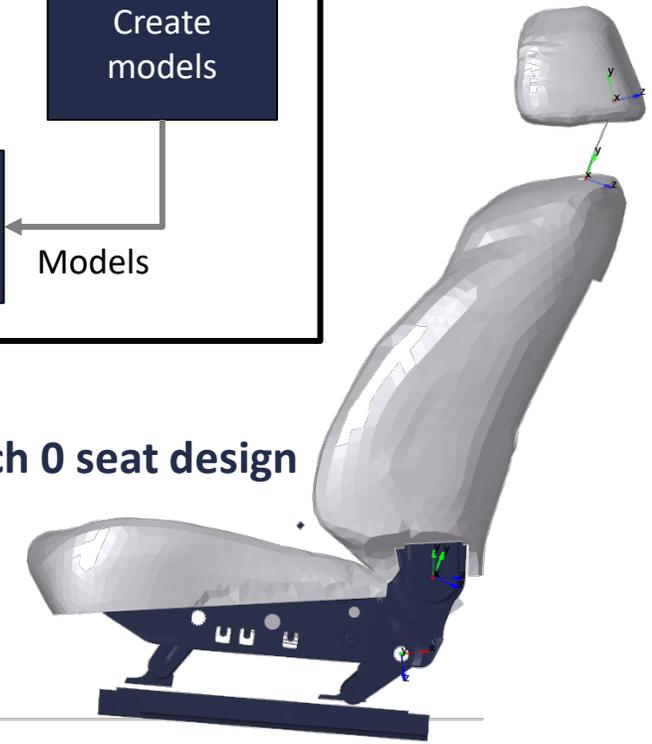

Simulation Automation Workflow

- **200 sampled seat designs** morphed from OpenVT seat selected using Sobol Sampling method
 - Each seat design is one Batch
- Within each Batch are scenarios
 - 0 – BioRID – No Pretensioner – IIWPG
 - 1 – BioRID – Pretensioner – IIWPG
 - 2 – THOR-50M – No Pretensioner – IIWPG
 - 3 – THOR-50M – No pretensioner – 301R
 - 4 – THOR-50M – Pretensioner – IIWPG
 - 5 – THOR-50M – Pretensioner – 301R
 - 6-9 – GBHMC-50M cases in similar pattern to THOR

Batch 0 seat design

Example simulations – IIWPG (16 km/h), No Pretensioner, Batch_1

- BioRid

- THOR-50M

- GHBMCM-50M

Example simulations – Pulse severities, No Pretensioner, Batch_1

- IIWPG: 16 km/h

- 301R: 36.5 km/h

Example simulations – Pulse severities and Pretensioner, GHBM, Batch_1

- IIWPG, no Pre-T

1: VIRTUAL_adultseat_materials
Loadcase 1 : Time = 0.000000 : Frame 1

Pre-tensioner

1: VIRTUAL_adultseat_materials
Loadcase 1 : Time = 0.000000 : Frame 1

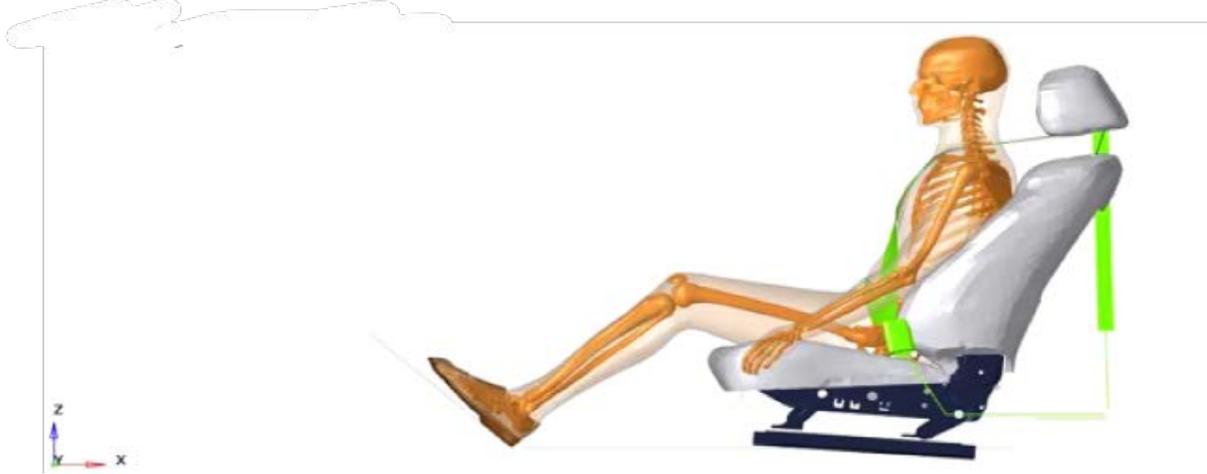

1: VIRTUAL_adultseat_materials
Loadcase 1 : Time = 0.000000 : Frame 1

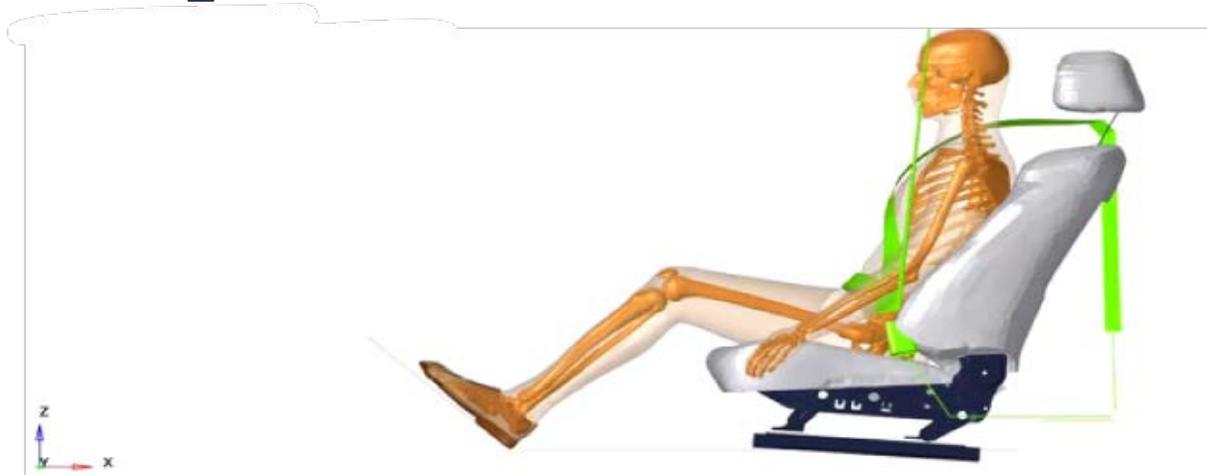

1: VIRTUAL_adultseat_materials
Loadcase 1 : Time = 0.000000 : Frame 1

Example simulations – Seat design variation, IIWPG, No PT, GHBMC-M50

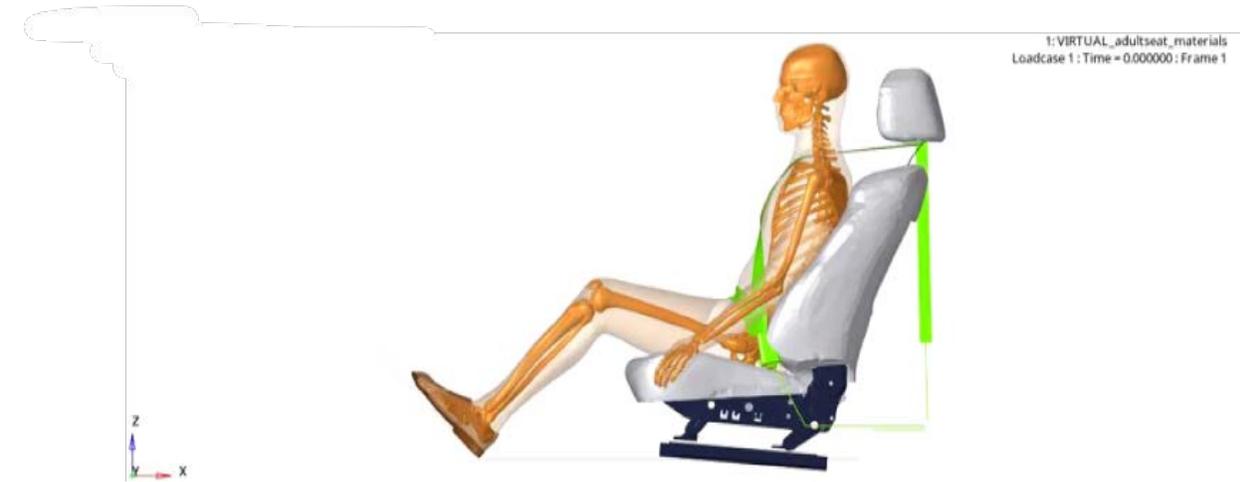

- Batch_5

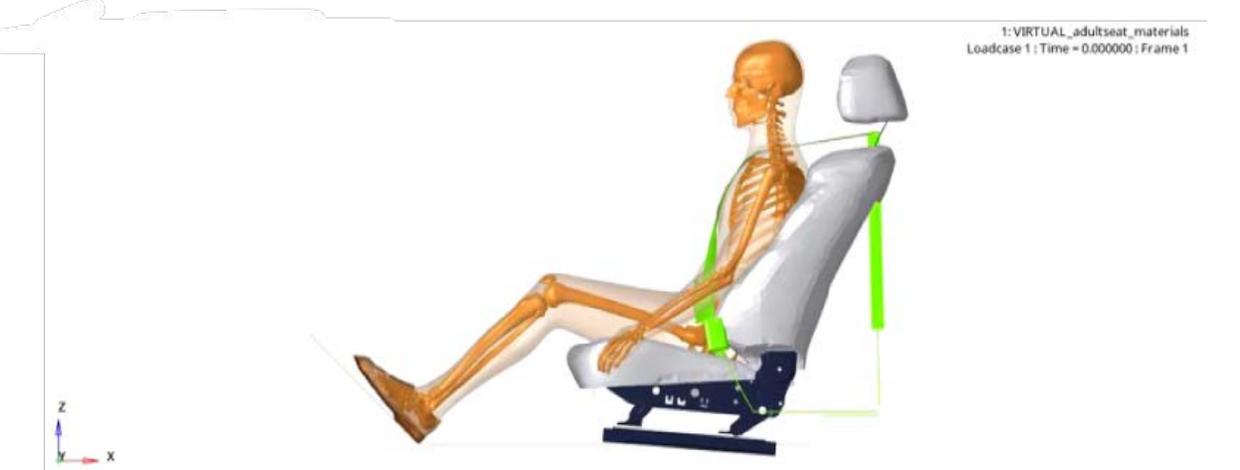

- Batch_6

- Batch_1

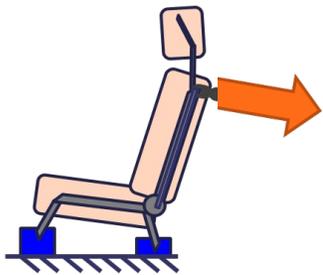

- Batch_9

Example simulations – Seatback collapse with 301R pulse (36.5 km/h)

Batch 2 seat model

Reminder – seat stiffness parameters are informed by tests of real seats

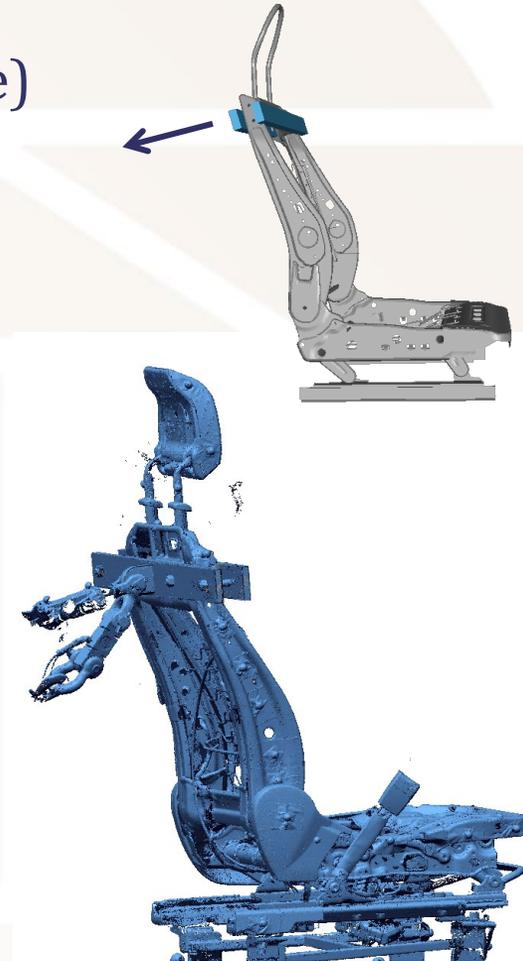

Note: Does not represent a specific seat, but the stiffness is in the range of tested seats

Parallel Work: Detailed Seat Modeling

Goal: Develop detailed FE models of two seats for open distribution (for research)

- Detailed tear down & scanning
- Component testing with deformation tracking (compression, pull to failure)
- Material testing
- Meshing & assembly
- Validation with low & moderate rear impact speed sled tests

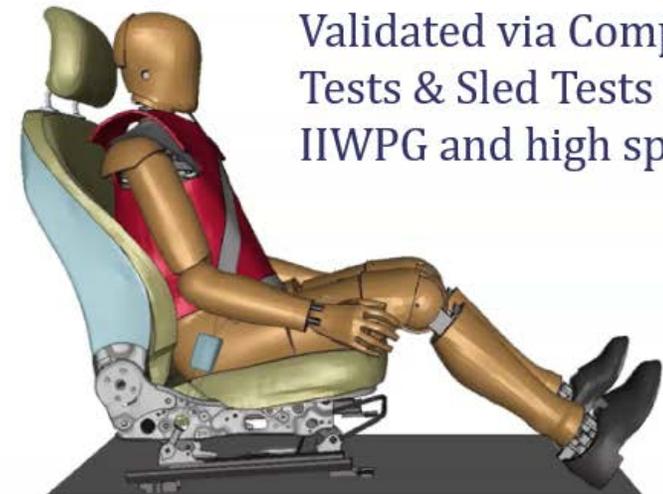

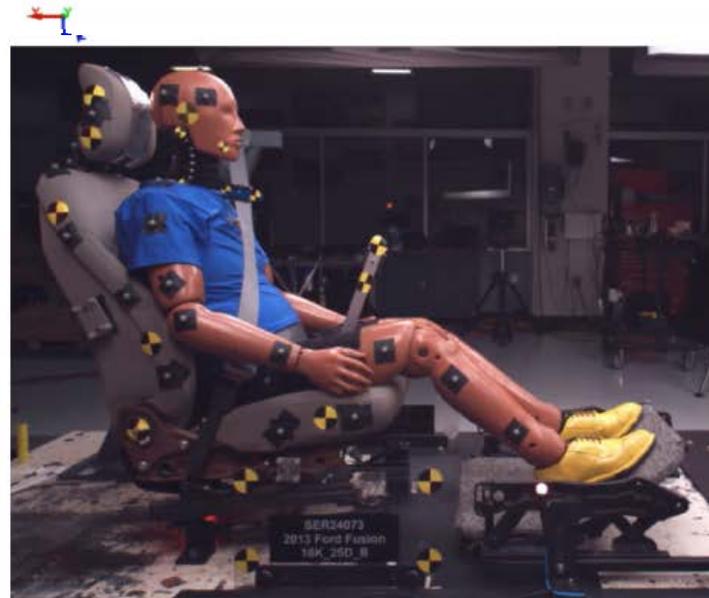

Detailed Seat Modeling

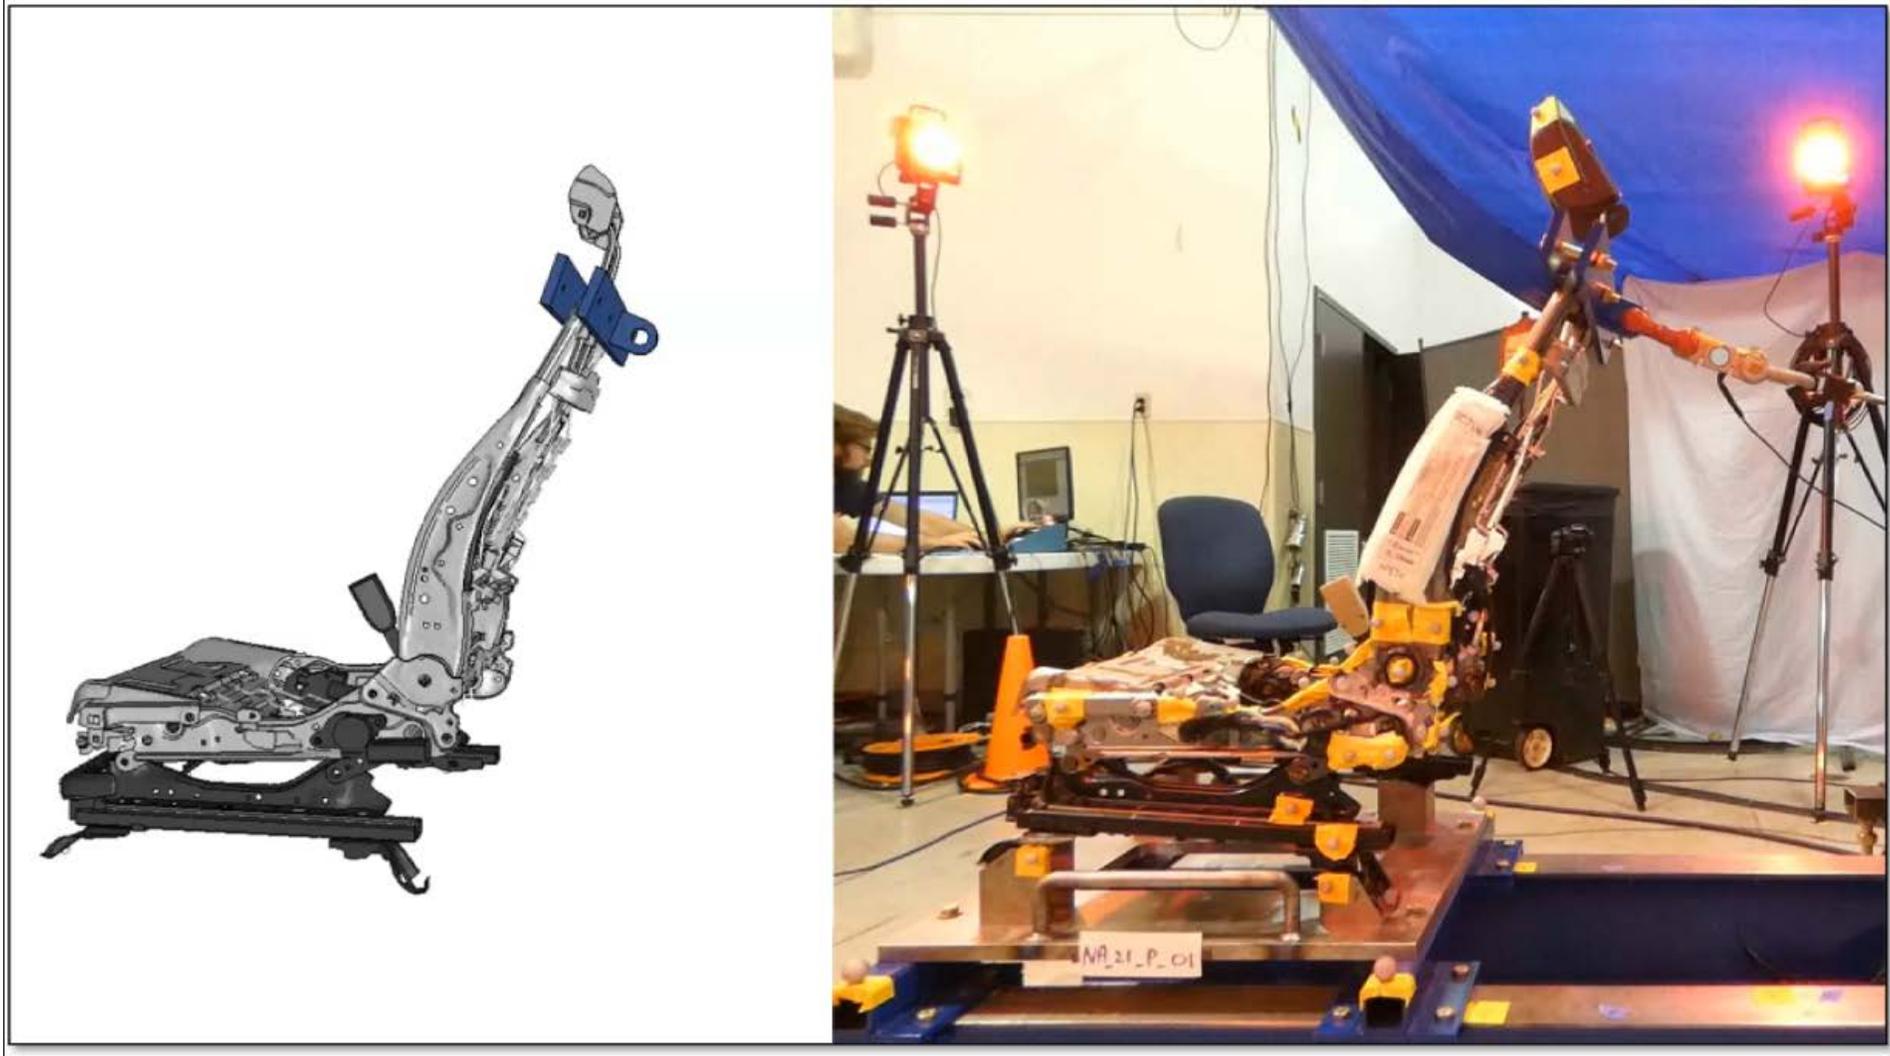

Ford Fusion Driver Seat
Time = 0

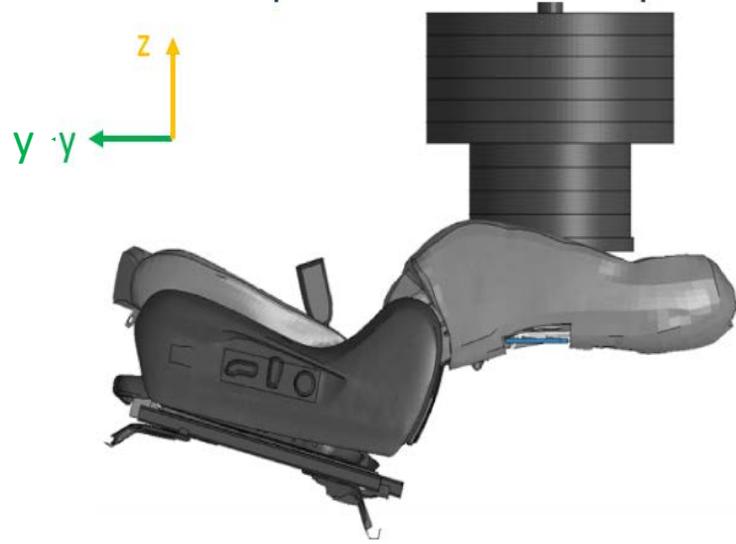

Bottom-Up Development
(from detailed geometry
& material properties)

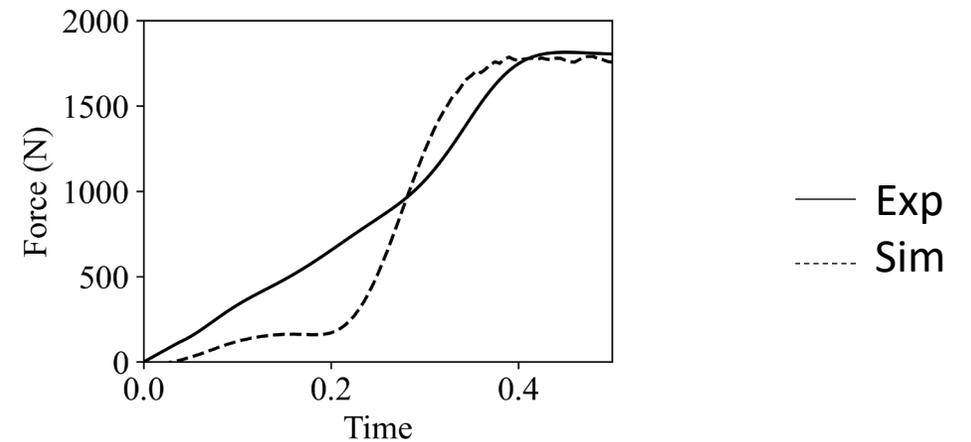

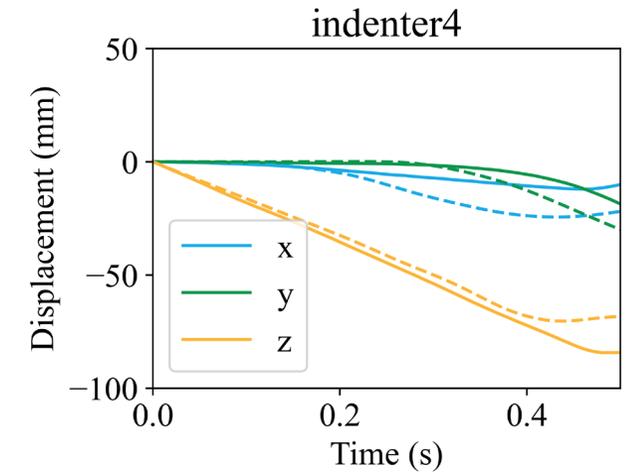

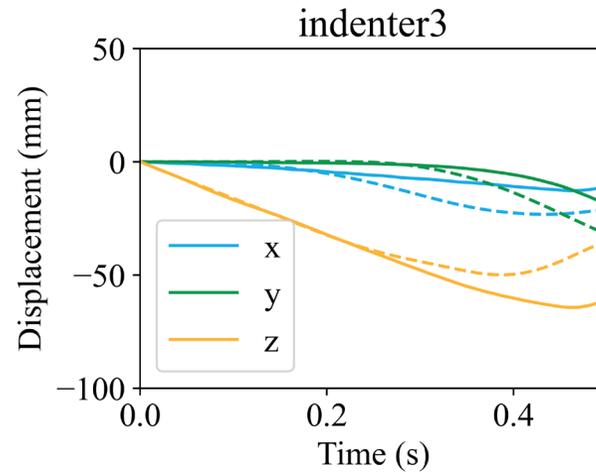

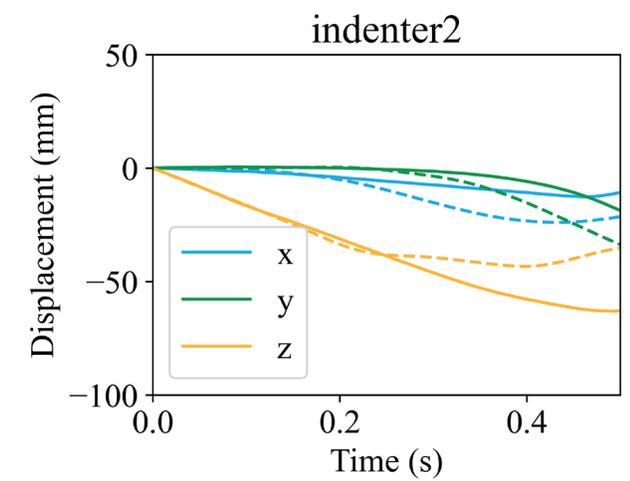

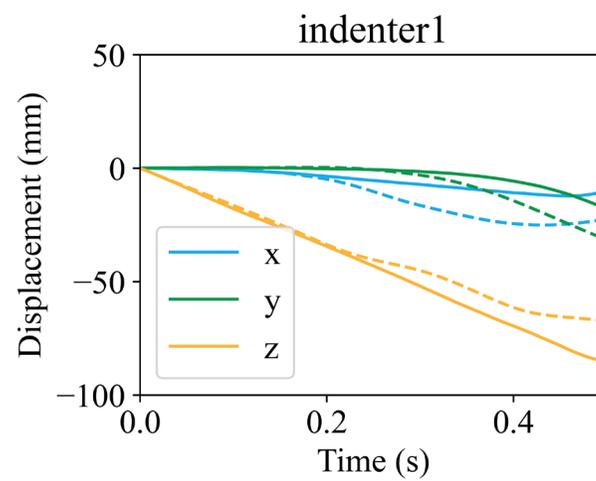

Validated via Component
Tests & Sled Tests (low speed
IIWPG and high speed 301R)

0.745±0.116

301R Pulse: 36.5 km/h

Also validated with IIWPG low-speed pulse (with BioRID)
Performed in collaboration with IIHS (Thank You!)

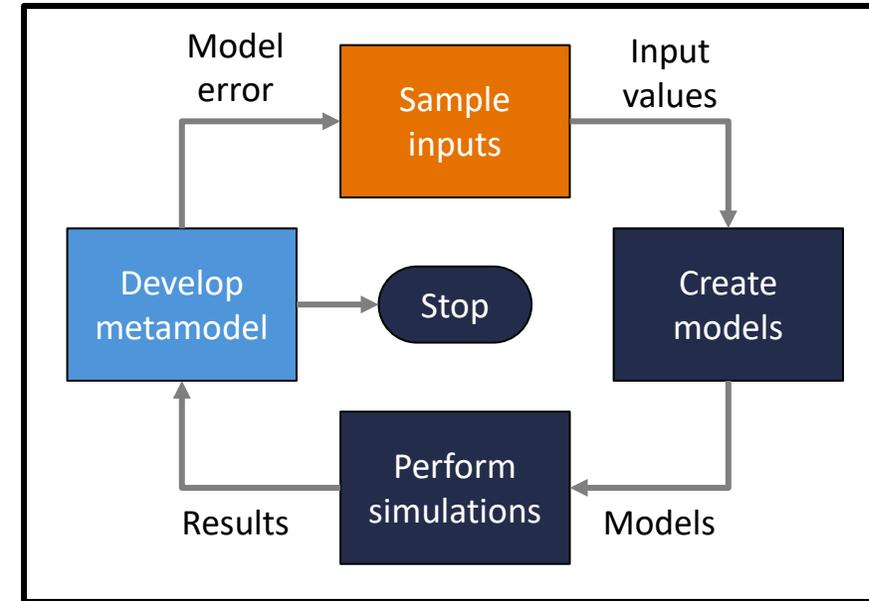

Next Steps

Parametric Modeling: Finalize Metamodels Describing Effect of Seat Characteristics on Occupant Responses

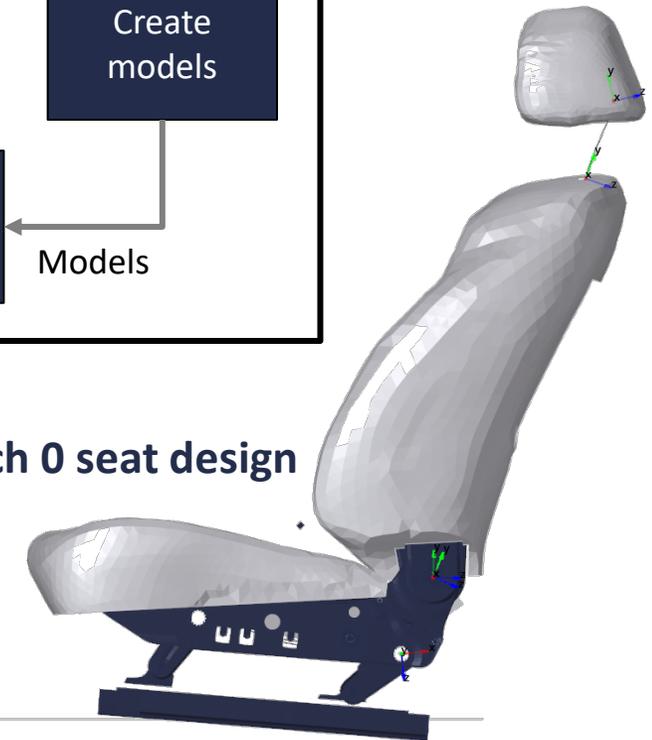

↳ Effects of seat characteristics in low-speed vs. high-speed impacts

Relationship between component evaluations and system-level response

Detailed Seat Models: Deliver for review and distribution

Batch 0 seat design

Parametric Seat Modeling in Rear Impacts
