**2009 Camry - Vibrations after stopping by [REDACTED]
May 27, 2009 (1:47 pm)**

When stopping at red lights and stop signs my brake pedal vibrates for several seconds immediately after the car comes to a stop. I think it might have something to do with the A/C because it doesn't seem to happen if I turn it off.

What causes this and is it something that should be repaired?

It's a brand new vehicle under warranty, take it back to the dealership to look at.

Try it with things off and then on. Leave your foot off the brake, set the emergency brake a couple clicks as you come to a coasting stop in neutral, foot off the brake pedal. Try to isolate it to a component, brake pedal, or A/C.. It could be something loose.

Like the first post have them look at it with any more info you can give them. Good Luck.
